

Azithromycin

az-ith-roe-MYE-sin

Brand Name: Zithromax

Drug Class: Opportunistic Infection and Other Drugs

Azithromycin, also known as Zithromax, belongs to the class of medicines known as antibacterials or antibiotics. These medicines kill bacteria (small organisms that can cause infection in humans) or stop bacteria from growing.

HIV/AIDS-Related Uses

Patients with weakened immune systems, including people with HIV, tend to have more frequent and more serious bacterial infections. Azithromycin was approved by the FDA on June 14, 1996, for many uses, including the prevention and treatment of *Mycobacterium avium* complex (MAC) in persons with advanced HIV infection. It is also being investigated to see how well it works in preventing other kinds of bacterial infections in people with HIV.

Dosage Form/Administration

Azithromycin comes in capsule and liquid forms that are taken by mouth. These forms should be taken at least 1 hour before or 2 hours after eating. The tablet form of this medicine is also taken by mouth, but it may be taken with food. The intravenous form is given by injection into a vein.

Contraindications

Individuals who have liver or kidney disease should tell a doctor before taking this medicine. This medicine may not be appropriate for patients with pneumonia.

Possible Side Effects

Along with its desired effects, azithromycin may cause some serious unwanted effects. Treatment with this medicine should be stopped and a doctor should be notified right away if the patient has any of the following after receiving the intravenous form of azithromycin: pain, redness, and swelling where the injection was given.

In a few rare cases, azithromycin has caused severe reactions. Patients should stop taking this medicine and notify a doctor right away if they have any of the following symptoms of a severe reaction: abdominal tenderness; diarrhea (severe and watery or bloody); fever; joint pain; severe stomach cramps or pain; skin rash; swelling of face, mouth,

neck, hands, and feet; or trouble breathing.

Other side effects may not be serious and may lessen or disappear with continued use of azithromycin. Less serious side effects include mild diarrhea, nausea, stomach pain, or vomiting.

Drug and Food Interactions

A doctor should be notified of any other medications being taken, including prescription, nonprescription (over-the-counter), and herbal medications, especially antacids that contain aluminum or magnesium.

Clinical Trials

For information on clinical trials that involve Azithromycin, visit the ClinicalTrials.gov web site at <http://www.clinicaltrials.gov>. In the Search box, enter: Azithromycin AND HIV Infections.
